

Chapter 20

Looking Ahead

Mother Earth, pursuing a Cosmic plan, is moving to wean her maturing civilization from the use of coal and oil for energy. Nuclear energy because of its unnaturalness, has failed to fill the energy gap as was promised thirty years ago. Therefore, in order to continue our forward progress, we must develop a concept of Universal power which is of such magnitude that the idea of absolute abundance and expanded opportunity replaces all ideas of lack and restriction.

Our first objective is to develop energy without the use of fuels. To attain this we need a science that is in tune with our current mental quickening and knowledge explosion. The adage, "Know ye first the Kingdom of Heaven and all else will be added," applies directly to such a science. As tomorrow's science will be a two-density Cosmic Science, such thinking and attitude will free us from falling victim to one-density, soap-opera-type emotions so common in many fields of endeavor. To understand Cosmic Science, it is advisable that we re-evaluate and re-define two terms: *reality* and *pure science*, which are commonly used to limit and restrict our thinking.

Since Life in this experience occupies physical bodies, we tend to think of "real" as being anything the senses can know directly. When Life withdraws from the body, that body

quickly begins to dissolve as do all biological forms unless they are preserved and protected. When Life and Consciousness leave the body they take with them the ability to know reality. The transfer from one state to the other, shifts reality to be that of the Other Density, which is closer to Infinity and has a more free style of Life support. The term "reality," then, will apply to any state of Life in which a Consciousness may become involved or to which it gives attention.

The term "pure science," as commonly used, implies a collective acceptance of the currently achieved level of science. By past recorded history we know that as long as progress is forward, tomorrow's pure science will always be ever deeper into the unseen and unfelt by the senses. A flexible definition of pure science, which is acceptable to two-density thinkers, must accept the idea that at any level of Life there is an achieved science, and around the corner towards Infinity, there is an achievable science; and always, both are pure science. The purest of all sciences is Cosmic Science, which issues forth from Infinity, the greatest of all densities that express outward to all lesser densities. The term "pure science," like "reality," designates the level of Life in which the awareness of the user is involved.

Two-density thinking is natural, because we are basically a duality: A positive body of eternal reality of being and a negative, electromagnetic body of flesh. The negative saturates and predominates the electric body and brain; thus it is easy to desire self-interest, to emotionally reflect on physical activities, and to mirror the exploits of so called greats, past and present, whose negative emotions and frustrations we cannot know. The positive self is ever present and speaks of reality which is a Consciousness of Being and a reflection of Infinity. In the strong, negative setting of planet Earth, this voice and its idealism has strong competition for audience. Any congealed, inanimate form, as a basic part of its makeup, has an outer energy field. Mankind, with two active and intermingled density bodies, has two intermingled, outer energy fields: the negative, electrical "aura" that has its apex below the feet,

relates to the more materialistic, left side of the brain and to the electrical density with its gravity energy; the positive, Other Density-oriented field has its apex above the head and relates to the right side of the brain and to the Other Density.

These contrasting energy fields are directly involved with a built-in weight factor of our bodies. There are times when we feel light on our feet while walking, running or dancing. There are times when we can climb a hill or do athletics more easily. Being light on our feet is partly a two-density happening. Our crystalline, pulsing blood stream, coupled into Living Light, instills Other Density Life quality into our electrical body. The Other Density's stable field is remote, and is the basic cause of our ever changing, electrical, emotional fields. We, in fact, are a walking, talking wonder beyond description. If, by emotional balance, the two-density combination of our negative vortex surrounded by the aura reaches balance with our upward spiraling, spiritual positive vortex, then lightness of this body occurs within our local environment. If this balance between the two influences should reach a state of equilibrium, in which the vortices are of equal length, diameter and speed of rotation, a state of levitation is possible at the zero (balance) point between the two fields. This balance cannot be brought about by will. It is a mental and emotional balance between physical wants and unselfish compassion. Working close to this balance in any field, scientific or otherwise, brings one close to attunement with Infinite Mind where all is known.

To a degree, Influence over physical weight can be demonstrated by a group of people expressing united thought and effort. The three photos (Fig. 27) show the results of an unrehearsed effort, done without props other than a camera to record the results. The heaviest of us at 240 pounds (108.9 kilograms) was easily lifted by the other four with only two fingers of each hand under the chair or coffee table. These lifts were done following a preparation consisting of holding our hands in random layers in the positive vortex above the head of the man being lifted, while breathing a little deeper than usual for about 10 to 15 seconds. This parlor trick, simply told

Fig. 27, PARLOR TRICK

by these photos, has been practiced by people in many generations, and the effect on those who try it is one of wonderment. Without the two-density theory, the happening is a mystery; with it, the designed happening becomes a revelation.

A broad guideline is necessary so that we do not become influenced beyond reason by what our senses tell us. Although our senses have a specific purpose, they only register a small bandwidth of electromagnetic reality. To our senses things appear to come forth from things seen. When we see our consciousness as observing outward toward electromagnetic experiences, we can readily see that a mental step backward towards Infinity would allow us to see our body as coming forth from the same stream of Life as do the effects which we study. Consciousness is a stream of Knowing, and always the lesser consciousness is observed by a higher consciousness. The Ultimate observer is Infinity.

Along with things easily seen, there are constant happenings that border the unseen. There were reports of sky quakes and explosions long before we had aircraft that made sonic booms. We only kid ourselves if we try to explain all such happenings as effects of our present knowledge and doings. Throughout recorded history there have also been reports of strange crafts in our skies. If we expand our inner knowing to mentally visualize an exotic space craft in the Other Density, which is devoid of electrical resistance, then we can readily visualize sophisticated space craft, large or small, as being possible in this density. In the Other Density, close to Infinity, a massive craft is made of strong force energy that readily responds to trained minds. Such a craft, made without the use of rivets and bolts, is then caused to travel by a mode parallel to what we will experience when we leave this electric, physical body behind. We can then move directionally and in distance by a desire to move, because the body-field responds to thought by becoming unbalanced. An unbalanced body in a balanced medium causes motion in the direction that is desired. At first, such a response to Mind may seem unnatural. This is not so to liberated, two-density thinkers. We practice the same action

and reaction in the physical, i.e., when we desire any of our appendages to move; we mentally desire the end result. If we wish to pick up an object, we do it by desire to pick it up. The internal fields and forces of our fantastic body respond to desire with organized tensions, strains and relaxing. When the desire is fulfilled, the action ceases, and the body goes into stand-by, in readiness for the next move.

A sophisticated Other Density craft, being free of electrical resistance, can travel great distances in a very short span of time. If the trip is to supervise something in the Electromagnetic Density and they wish to be seen, they can take on electromagnetic filler and by resistance become either some form of light, or with more electric filler, a craft that appears material to us. There are untold levels of Life in the Other Density and many levels of sophistication built into crafts. Some of the lights that we see as a phenomenon, do not require a craft to make them. A high level Consciousness, manipulating a strong energy body can travel and become visible in our density as light or form. Anything that creates a resistance to Electromagnetic Light in motion, can manifest light.

Visitations from the Other Density into this side is as natural as is our entering the Other Density upon, so called, death. A strong force craft can enter the electric density; however, absolutely no electromagnetic substance in form can penetrate the Other Density. This is one reason why our physical ego of experience may shy away from even admitting the possibility of another Life experience. To our electrical ego, such a condition seems inconceivable.

Electromagnetic spaceships can operate at any level of the Electromagnetic Density, but a ship designed to operate in a planet vortex cannot operate in free space between solar systems or free space beyond them. Massive ships that travel at the great velocities common to Electromagnetic Light, use combined solar system and planet functions for power and life support. The basic power source of the craft is that of coupling into primary electrical force to create a secondary function, not that of copying the Sun principle, but rather the orbit

motion of the electron-like planets that move about the Sun. A planet with its gravity field containing its moons and their unbalanced orbits, make a combined group of spheroids. The core in each case is the apex of the ingoing forces which contain the planet. This physical mass is driven in spin and in its orbit about the Sun, by a combination of fields upon fields.

The solar system principle is that of a Sun force spiraling outward and an interchange of forces within the system. It is though first an ingoing vortex within which planets orbit and spin in their vortices. The basic planet electron balance force is similar to that encountered in our electricity, where a magnetic field can create a flow of electrons in a wire. On a spaceship, a rotating field concentrates energy flow inward and then from the hull of the ship as emissions, to give energy thrust propulsion in energy space.

Electrical space, besides driving streams of lines of force, is a conglomerate of vortices, eddie currents, whirlpools and, as found in biological membranes, neutral zones that allow free flow through them. When a massive ship approaches a condensed world in its vortex, it takes on substance common to the vortex and, in a sense, reverses its drives to find balance in the gravity vortex. This reverse factor in small craft, dubbed flying saucers, is the cause of stoppage of electrical flow in our generated electricity. The bottom field of the craft repels the electron juice of Earth polarity and, in a sense, freezes it in our circuits. When the craft leaves the area, our electrical systems operate as usual and survive the interference without apparent harm. Even a bolt of lightening could not easily gain satisfaction or balance from Earth in this field, as it would be able to do at a distance from it. Similar polarities repel, and thus when we hear of this incident of electrical stoppage, we may be assured that these craft demonstrate force common to our electricty, which is positive and negative, also hot and cold, and light and dark.

February 19, 1968, a group of young people came upon an electrified Space Craft on Vashon Island near Seattle, Washington. When it took off, it left a 2-inch layer of ice on an adjacent pond. The temperature in the area was 50°F. The ice had bubbles in it and was milky in appearance. This was

verified by country sheriff officers who were called to inspect the landing site. What is important to note here is that the cool polarity of Earth was further cooled by the parallel liftoff field of a certain type of natural electrical craft.

The amount of energy in the form of sunlight that falls upon Earth each day is small compared to the amount that is delivered to Earth by Electromagnetic Light in the form of positive and negative lines of force, and by secondary action within these lines of force in the form of curved vortices which make all Suns, also planets, all of which are negative balance to Suns.

Life support is possible in any Solar System throughout Living Space or on any properly designed space craft in either the Electromagnetic Density or the Other Density. The life style in each setting is necessarily different as each density serves Life in a specific manner. In the Other Density of law and order, life wants are simple and need not be grown, gathered or manipulated into shapes by tools, heat or various other methods as we do here. Neither is there any need to dispose of human wastes and electromagnetic contamination, because there is none. What is not simple in the Other Density is stern orderliness. In the electric density we suffer from want if we do not conform; in the Other Density we suffer from lack of freedom if we do not conform. These alternate settings of Life are schools for self-knowing souls which are sophisticated memory banks. Each setting of Life has special gifts for those who use choice and self-knowing.

As choice is given to mankind by Infinite Creative Spirit as a direct donation of a quality and privilege of the self, no one has the right to take this personal privilege away from another by any form of slavery, nor does anyone have the right to dictate how fast, or how slow, another accumulates soul qualities. When in this setting we are inclined to ask, "If there are flying saucers and space craft, why don't they prove themselves to us in such a way that we have to believe?" The answer is closely related to our privilege of choice. Entities who are

capable of Space travel by natural means, have also learned to respect and to apply Cosmic Laws. They will not interfere with our choice, in spite of the fact that by so doing they might help our physical situation. The opportunity to know is a personal gift, and often the lesson learned through some situation which seemed hopeless, is a treasure to our soul. If entities from outer Space should forcefully interfere with our civilization's right of choice and our natural development in this school of Life, they would be as guilty of cheating as would those in a public school system if they allowed the students free access to the answers to problems which the students were supposed to decipher in their own way.

The circumstances that make our rough school so effective is that the many cultures, ideologies, trades and great variety in all things common to Life, are so natural that we tend to believe their pursuits, emotions and desires to be a product of Mother Earth, rather than of Life that is experiencing Mother Earth. In line with this, there is a personal and collective hang-up in physical science that is currently holding back a great breakthrough in energy and even prohibiting co-operation from those who visit us in craft strange to us. This hang-up is that a broad branch of physical science believes, and attempts to prove, that the Electromagnetic Density is the only setting of Life, and that the *strong forces* that are known to exist are subservient to this electrical density. When they cannot measure an unusual ability of a fellow man by electromagnetic means, it is deduced that such must either be a hoax or some undiscovered, electrical happening; the nature of which is not yet known. This hang-up is in line with a confining thought that the electrical density is the only density, and that Life in it happens to its electrical material.

Self liberated mankind, in order to eventually experience unlimited Space travel, needs first to accomplish two major breakthroughs, i.e., we must develop systems of energy without the use of fuel, and also, systems of instant communication with far reaches of Space. Aside from the electrical energy,

both in motion and congealed in mass, there is a medium of nonelectrically charged energy. This medium, because it has no resistance, offers instant communication over vast distances.

When you and I carry on a conversation in a normal manner, we are two entities, based in the Other Density, causing thoughts to become electrical vibrations (voice) in the Electromagnetic Density, then deciphering those sounds to again become thoughts. In the Other Density, thoughts can travel direct from Mind to Mind without the necessity of transfer through the electrical medium by voice. Our physical ego cannot know such direct Mind to Mind communication because that ego is electrical and must depend upon biological transducers to convert a thought into a vibration which can be expressed as a sound.

Most of us, either accidentally or by intent, have experienced direct, nonelectric transfer of thoughts in the medium of Mind. We call it ESP (extra sensory perception). This is not accepted as being natural by most accredited science teachings because their common dedication is to prove that the electrical density is the cause of the nonelectrical forces encountered in their experiences. Nevertheless, regardless of what we believe, when we lose this body through death, we revert to communicating Mind to Mind. In the nonelectric state, attention of the entity directs thoughts to others as we do here, but without transferring them through the electric medium.

Instant communication with far reaches of Space can be accomplished by copying our natural personal ability to transfer a thought into an electrical vibration and/or an electrical vibration into a thought. A thought is projective and therefore outgoing and of positive polarity. The receptor then must be negative and elliptical in shape. As the end of a nerve is a receptor, it is a good example for designing sensitive receptors that react directly to thoughts. In the August, 1960 *Scientific American*, there is an article by Werner R. Loewenstein entitled "Biological Transducers." On page 103 are illustrations of a nerve end. On it is a transducer that triggers the nerve impulse and an elliptical (negative) mass that encloses the transducer

and serves as an antennae for it. If the desire for long distance communication is from an electrical body, and the message is from senses to senses, then transmitting a thought signal is from negative to positive and back to negative, or from one state of Life to another, parallel state, which may be entirely different from Life as we know it. The medium for transmission is that of two density Space with the carrier in the Other Density for instant reaction.

Cleve Backster, Marcel Vogel and others have found that living plants respond to emotions, and that a signal from a leaf fitted with an electrode can be amplified electrically to register that transfer of emotion on a meter. What is important in this discovery is that there is a common medium in which thought operates and that this medium is a carrier of messages. This message medium is common to all life forms and the response is registered in the electrical body.

December 25, 1978, *San Francisco Chronicle* carries a *New York Times* article entitled "Physicists' Big Breakthrough." This article tells of detecting the neutrino factor of atomic forces on the opposite side of a large hill from where a neutrino beam is allowed to escape from the Illinois based Fermilab particle accelerator. The article, by Malcolm Browne, is quoted in part:

Scientists from Western Washington University say they have carried out the first successful demonstration that neutrinos—mysterious nuclear particles that have neither electric charge nor mass—can be used to carry messages through the earth.

To do so, the scientists say, they used a "telescope" of their own design to "see" a beam of waste particles originating at the Fermi National Laboratory, known as Fermilab, in Batavia, Ill., which passed several miles through hills.

The leader of the group, Dr. Peter Kotzer, believes that the technique will eventually permit global communication even with deeply submerged submarines by neutrino beams passing through the seas and the earth itself.

but we belong to Space, and when we have thus qualified to participate, we will be qualified to exchange ideas on unrestricted space travel in sophisticated craft.

Our breakthrough in science and our relief from self-imposed bondage depends on not trying to change others, but on personally and collectively keeping pace with the fast cyclic change that is upon us and is taking us into a more positive setting. As we are being swept into this change with no means to stop or slow the pace, our obligation is to accept it on Cosmic terms. We who keep pace must do so by our own choice. We are all virgin to the area of space into which we are moving, but each of us has a tangible tool that we can use to move harmoniously into it. This tool is mental flexibility, and if we are flexible the shift will be relatively painless. We are two-density beings well equipped to cope with change. It does, however, call for control of Earthly emotions and emotional ties. Past history is full of accounts of gradual change and its strains; but when the change comes quickly, the strain is greater and calls for greater flexibility for those who wish to participate in it with harmony and enthusiasm.

There is no need to limit ourselves. Mankind of Earth has keen inner knowing and has often demonstrated that if an achievable goal is seen, they can perform seeming miracles to achieve it. The goal ahead is still invisible, but it is there and we have much more ability to see into the unseen than we had a few hundred years ago. The question now is: "Can we visualize the unseen Cosmic Plan for us and perform in tune with it?" If we so achieve we will go into Cosmic records as a great civilization. We dare not think of inviting any alternative when the opportunity for achievement is so great.
